| <b>Background:</b>       | The protein encoded by this gene belongs to the calreticul in family, members of which are calcium-binding chaperon es localized mainly in the endoplasmic reticulum. This prot ein is also localized to the endoplasmic reticulum lumen, h owever, its capacity for calcium-binding may be absent or much lower than other family members. This gene is specif ically expressed in the testis, and may be required for sper m fertility. Mutation in this gene has been associated with familial hypertrophic cardiomyopathy.
